Subject: Sonera Visit - Foak Status

Hi Everyone,
I would like to report to all of you, those that witnessed the meeting as well as the others on the results and the great success of the deployment of the whole system in Sonera.

The experience was amazing. The system that we delivered was composed of components from Haifa, Zurich and Watson. It was integrated by Shmuel who did an outstanding work.

The components included were:

- SEE - Service Execution Environment from ZRL
- NaSS - Notification and Synchronisation server from ZRL
- GenJTAPI with JTAPI simulator from HRL
- Service Creation (Service Packaging) from WRL
- Service Provisioning and Subscription from HRL
- Service Management demo from HRL

The complete system was deployed and part of the management tasks were deployed on WebSphere that was installed in Sonera.

With some minor problems, unrelated to our own delivery, things worked like a charm after 2 hours.

Note: the main problem was related to webSphere and was caused as a result of one of the Sonera people renaming the Java JDK1.1.7 which is required by WebSphere.

What was even more amazing was the fact, the once the system was installed and working using the JTAPI simulator, it was replaced by the JTSPi implementation Sonera team implemented for their OSN switch. Without any problem at all, things work immediately and phones started to ring. The follow me service was working without a problem.

This was real impressive as it proved many things. It is really rare that so many components that are integrated from different sources including one from Sonera work on first coup.

The NaSS, handled the hot provisioning immediately, and proved the advantages of the technology. The Subscription was using the new XML technology and the NaSS was notified and delivered the information to the SEE which executed the services with the new information immediately. It was all working with the phones.

I would like to say Kudos to the team that did excellent work and could also show that they could overcome many difficulties and get a project as complex as this one working.

Moreover, this was a real research project and results and conclusions will be reported separately. There will be several important invention disclosures as well as papers resulted of this work.

In the meantime, we shall complete our work that was left until August and will start fresh.

Thanks to you all and to Jurij for his leadership and persistent.
I am sorry he did not have the chance to hear the phones ringing, but it was
